

VISION CONTROL FILM

Misty-Clear-Misty

Z-2555

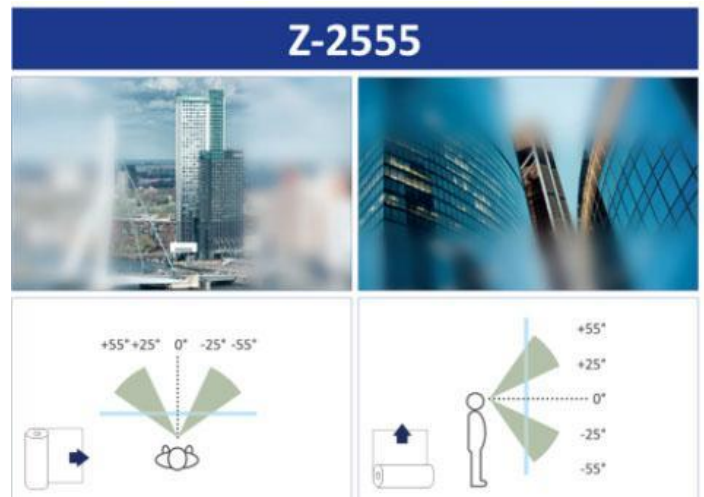

The Vision Control Film is the alternative to the original Lumisty product which has been discontinued, it provides a unique way of controlling the view. As you change your viewing angle, the glass changes its appearance from clear to frosted. With 4 different types of window film to choose from, Vision Control Film offers an effective solution to control visibility. Applying this film to a window enables controlled privacy and creates a novel effect.

FEATURES & BENEFITS:

- The film transmits approximately 88 % of the visible light, regardless of whether it is clear or frosted.
- The film surface is hard-coated for improved scratch-resistance.
- The film protects the glass against shattering if broken.
- Damaging UV light transmission is significantly cut.

SPECIFICATION:

Available Width	1250mm (49.2")
Standard Roll Length	15m (50")
Application	Internal
Adhesive Type	Pressure-Sensitive
Base Material	Polyester

**Images shown are for indicative purposes only.*

NOTES:

Vision Control Film is a unique, delicate film requiring special care, during and after installation. Please take note of the following precautions before installing the film.

- **Place of Installation**

Vision Control Film is designed for interior application to flat glass surfaces only. Please do not use this film in places with high humidity or high temperatures such as bathrooms, swimming pools, or outdoor environments.

- **Interference fringes**

For window films coated with a wear resistant layer, certain indoor light sources or sunlight reflected at the film's surface may show interference fringes. This phenomenon occurs because the light of specific wavelengths reflected at a thin film, such as the scratch resistant layer, interferes constructively. Therefore, please note that the film surface can cause an iridescent appearance (oil on water effect).

- **Durability**

Vision Control film is made from multiple layers of organic material. Ageing will occur during the lifespan of the film: the angle, color, and haze may change with time. The durability is affected by the installation and application environment. It is therefore not possible to offer a precise life indication.

- **Adjoining installation**

The external appearance of the film, including the angle and haze, may differ across each production batch. Please take care to use products from the same production batch for adjoining installations.

- **Installation**

Vision Control Film has a directional effect and is a thick film. The installation method therefore differs from that of a regular window film. We recommend that the installation is carried out by highly skilled, professional window film installers only. A test installation should be carried out prior to definitive application.

- **Water residue after installation**

A small amount of the film installation fluid remaining between the glass and the film after installation may appear as bubbles or the glass surface may temporarily become cloudy. This will clear gradually as the moisture evaporates, but it may take longer in areas of limited sunshine, low temperature or high humidity. Please allow plenty of time for the film to completely dry after wet application.

- **Maintenance**

When cleaning the film, treat it as you would an LCD monitor. Vision Control Film is a unique, delicate film requiring special care.
